

Pesticide Data

Meeting Pest Scouting and Pesticide Use Requirements

Specification Development

AgCode's Total Field solution allows the user to create specifications and tailor them to a site, a specific pest problem and a level of infestation. Specifications can be communicated either in written form or electronically thru AgCode Mobile™.

Site Verification

AgCode Mobile™ allows field personnel to record chemical applications before and during the season to monitor plant back or harvest restrictions. Equipment configuration, personnel and detailed pesticide use can also be recorded as part of this process.

Pest Scouting

AgCode Mobile™ can document all IPM scouting sessions to record aggregate data for the field or GPS point data for specific recordings. Using bar codes and AgCode's data point methods, reading and analyzing IPM traps or bait stations is an easy and accurate process.

Reporting

The PCA can audit all data recorded through the handheld to verify accuracy for in-house and state reporting needs. Standard Pesticide Use and tailored reports are available through AgCode.Net's dynamic reporting engine.

Electronic Pesticide Use Reporting

AgCode can work with your local and state authorities to allow for electronic PUR submittal. AgCode presently submits California Pesticide Use data through the RMMS & CEDTS systems.
